Introduction
Deep Learning has become a robust machine learning tool in recent years, and models based on deep learning have been applied to various fields. However, applications of deep learning in the field of computational finance are still limited1. In our project, Long Short Term Memory (LSTM) Networks, a time series version of Deep Neural Networks model, is trained on the stock data in order to forecast the next day’s stock price of Intel Corporation (NASDAQ: INTC): our model predicts next day’s adjusted closing price based on information/features available until the present day. Based on the predicted price, we trade the Intel stock according to the strategy that we developed, which is described below. Locally Weighted Regression has also been performed in lieu of the unsupervised learning model for comparison.

Dataset

<table>

Data Preprocessing and Features

The input features we choose consist of three sets of variables. The first set is historical daily trading data of INTC including previous 5 day’s adjusted closing price and log returns, Open/Close price, High/Low price, and trading volume. These variables provide basic information about INTC. The second set is the technical indicators that demonstrate various characteristics of the stock behavior. The third set is index: S&P 500 (‘SPY’), CBOE Volatility Index (VIX), and PHLX Semiconductor Sector (‘SOX’).

1. **Daily Trading Data of INTC**
   - Previous 5 days’ prices and log returns
   - Open/Close price, High/Low price, and Trading volume

2. **Technical Indicators of INTC** (computed based on the trading data)
   - Rolling Average/Standard Deviation with 5 and 10 days window
   - Bollinger Band: two standard deviations from a moving average
   - Average True Range: a measure to volatility of price
   - 1 month Momentum: the difference between current price and the price 1 month ago
   - Commodity Channel Index: an identification of cyclical trends
   - Rate of Change: the momentum divided by the price 3 months ago
   - Moving Average Convergence/Divergence: a display trend following characteristics and momentum characteristics
   - Williams Percent Range: a measure of the buying and selling pressure

3. **Index of the Market and Sector**
   - S&P 500, VIX, and PHLX Semiconductor Sector

   *All of the variables are scaled between 0 and 1 before we feed them into the model.

Models

- **Long Short Term Memory (LSTM) Networks:**

  LSTM Cell:

  ![LSTM Cell Diagram]

  **Parameters For LSTM:**
  - Optimizer: AdamOptimizer
  - Library: Tensorflow
  - Hidden layers: 5
  - Delay: 10
  - Training Step: 5000

  **Mathematical Format for LSTM:**
  \[
  \begin{align*}
  \hat{x}_t &= \mathbf{W}_x [x_t, \hat{x}_{t-1} + b_x] \\
  \hat{h}_t &= \mathbf{W}_h [h_{t-1} + x_t, \hat{h}_{t-1} + h_t] \\
  \text{gate} &= \sigma (\mathbf{W}_\text{gate} \cdot \mathbf{h}_t + b) \\
  \hat{c}_t &= \mathbf{W}_c [x_t, h_{t-1}] + \text{gate} \cdot \hat{c}_{t-1} \\
  c_t &= \text{gate} \cdot c_{t-1} + \hat{c}_t \\
  \text{gate} &= \sigma (\mathbf{W}_\text{gate} \cdot \mathbf{h}_t + b) \\
  \text{output} &= \text{gate} \cdot \mathbf{W}_o [x_t, \hat{c}_t] + b_o
  \end{align*}
  \]

- **Recurrence Structure of LSTM:**

  ![LSTM Structure Diagram]

  **Mathematical Format for 0 in LWR:**
  \[
  \theta = (X^TWX + 1)^{-1}XY
  \]

  **Weights for LWR:**
  \[
  \sigma = \exp \left(\frac{(\gamma \times \theta - 1)}{2}\right)
  \]

Trading Strategy

Every day in the test set, we use the trained model to compute the predicted price. If the predicted price of the next day is higher than the current actual price, we buy one share of INTC. In contrast, we sell one share of INTC if the predicted price is lower than the current price. The strategy can be described as follows: At time t, buy one share of INTC if \( y_{t+1} > y_t \) or sell one share of INTC if \( y_{t+1} \leq y_t \), where \( y_{t+1} \) is the predicted price by the model and \( y_t \) is the current adjusted closing.

Outcome from Experiments

- **Mean Square Error (MSE) of LSTM and LWR:**

<table>
<thead>
<tr>
<th>Period</th>
<th>LSTM</th>
<th>LWR</th>
<th>Test Error</th>
</tr>
</thead>
<tbody>
<tr>
<td>I</td>
<td>0.000991216</td>
<td>0.005116574</td>
<td>0.00646553</td>
</tr>
<tr>
<td>II</td>
<td>0.003549466</td>
<td>0.004481922</td>
<td>0.00517254</td>
</tr>
<tr>
<td>III</td>
<td>0.008638225</td>
<td>0.01662774</td>
<td>0.011428699</td>
</tr>
</tbody>
</table>

- **Daily Returns of Strategy based on LSTM, LWR and Buy-and-Hold for Test Set:**

<table>
<thead>
<tr>
<th>Period</th>
<th>LSTM Network</th>
<th>LWR Model</th>
<th>Buy and hold</th>
</tr>
</thead>
<tbody>
<tr>
<td>I</td>
<td>0.492666</td>
<td>0.255020</td>
<td>-0.083255</td>
</tr>
<tr>
<td>II</td>
<td>0.285289</td>
<td>0.152761</td>
<td>0.103849</td>
</tr>
<tr>
<td>III</td>
<td>0.190888</td>
<td>0.054216</td>
<td>-0.06555</td>
</tr>
</tbody>
</table>

- **Daily Sharpe Ratio of Strategy based on LSTM, LWR and Buy-and-Hold for Test Set:**

<table>
<thead>
<tr>
<th>Period</th>
<th>LSTM Network</th>
<th>LWR Model</th>
<th>Buy and hold</th>
</tr>
</thead>
<tbody>
<tr>
<td>I</td>
<td>0.583536</td>
<td>0.284026</td>
<td>-0.096499</td>
</tr>
<tr>
<td>II</td>
<td>0.235281</td>
<td>0.14540</td>
<td>0.102692</td>
</tr>
<tr>
<td>III</td>
<td>0.31649</td>
<td>0.092015</td>
<td>-0.110843</td>
</tr>
</tbody>
</table>

Price Predictions and Return Plots

- **Period I:**
  - Predicted Stock Price VS Actual Price of INTC (Daily)

- **Period II:**
  - Returns of Different Models VS Actual Return of INTC

- **Period III:**
  - Returns of Different Models VS Actual Return of INTC

Conclusions

- Both LSTM Network and LWR model can predict the general trend of INTC stock price, and LSTM outperforms the LWR in terms of accuracy and profitability for three periods.
- The performance of LSTM is more robust than the LWR. LSTM has smaller MSE than LWR for both Dev Set and Test Set, and it has less deviation in the prediction price plot.
- The strategy based on LSTM yields higher returns and Sharpe Ratio than LWR-based strategy and simple Buy and Hold Strategy.
- However, the prediction by these models become inaccurate when the price changes dramatically.

Outlook

- Tuning hyper parameters and adding regularization terms would improve the performance of LSTM.
- Trading strategy with reinforcement learning could generate more stable and higher returns.
